LETTER OF TRANSMITTAL

Raleigh, N. C., November 17, 1933

To His Excellency, J. C. B. Ehringhaus, *Governor of North Carolina*, Raleigh.

MY DEAR SIR:

I have the honor of transmitting the report for the Bureau of Vital Statistics covering the calendar year, 1932.

With assurance of my very great respect, I am

Very sincerely,

James M. Parrott, Secretary and State Health Officer.

p/e

INTRODUCTION

HISTORY

The Bureau of Vital Statistics was created by an Act of the General Assembly of 1913 which made the State Board of Health the custodian of all records of births and deaths, and the Secretary of the State Board of Health, by virtue of his office, State Registrar of Vital Statistics.

The first annual report published by the Bureau of Vital Statistics related to 1914. Reports have been published for every year since, with the exception of 1918 and 1919.

North Carolina was admitted to the United States Registration Area for deaths in 1916 and for births in 1917. The Registration Area is made up of those states in which presumably 90 per cent of the births or deaths are registered with the Bureau of the Census, with satisfactory completeness regarding certain collateral information deemed pertinent.

The present report follows the plan begun in 1931 in that the abridged International List of Causes of Death has been used in tabulating deaths by counties and cities, in preference to the complete list used prior to the 1931 report. Information for the State as a whole has been tabulated according to the detailed International List of Causes of Death. Anyone desiring more complete information regarding any item can secure it by inquiry to the Bureau. For 1932 an attempt has been made to allocate the deaths to the place of legal residence of the deceased before death. Formerly deaths have been recorded by place of occurrence only. This gives a distorted rate for those counties that have medical centers within their borders as well as for the counties from which the patients are drawn. In the present report the total number of deaths and deaths from certain specified diseases are given both by place of occurrence and by place of residence.

Although an attempt has been made to correct one, probably the greatest, source of error in comparing the rates of different localities there are other factors that must be taken into consideration. The rates given in this report are crude rates, in the calculation of which no allowance is made for the differences in the sex, age and color distribution of the population. For the State as a whole, 90 per cent of the deaths are believed to be reported. For any single area this percentage may be above or below that figure, and this degree of completeness of reporting deaths should also be borne in mind when comparing two areas.

The registration of a birth occuring in North Carolina makes it possible for the individual always to obtain an official record of the facts

surrounding his advent into life. The purposes for which certified copies of birth certificates are requested indicate that their value is becoming more generally realized from year to year. Likewise, the demand for death certificates shows that this vital record is essential in upholding the right of citizens in the establishment of necessary facts in the closing event of life.

POPULATION

The mid-year population of the State in 1932, as estimated by the Bureau of the Census, was 3,244,000. The estimate for 1931 was 3,217,000. This gives an increase of 27,000 over 1931. Incidently, the natural increase in population in 1932, i.e., the excess of births over deaths was 46,723. Of the total number of North Carolina's inhabitants 70.6 per cent (2,289,000) are white, 28.9 per cent (938,000) negro and 0.5 per cent "other races," the majority of which are indians. Approximately 0.3 per cent are foreign-born. In the total population females are slightly predominant. In 1930 there were 98.8 males per 100 females. While this ratio applies to the entire population, in the specific age groups the relations vary. In 1930 the proportions were:

Age Groups	Males Per 100 Females
15-19	98.1
20-24	90.1
25-29	89.0
30-34	93.3
35-44	95.6
75 and over	92.1

In the other age groups the males outnumbered the females.

NATALITY

Live Births: In 1932 there were 77,880 live births registered which is equivalent to a rate of 24.0 per 1,000 population, an increase over the rate of 23.2 for 1931. Of the 77,880 live births 53,655 were white, 23,602 negro and 623 indian, which gave a ratio per 1,000 population of 23.4 for white, 25.2 for negro and 36.6 for indian. The difference between the white and negro rates is approximately the same as that prevailing in former years. For the first fifteen years of State registration the birth rate ranged between a high of 33.4 in 1915 and a low of 27.5 for 1928, remaining above 30, the greater part of the time. How-

ever, there has been a gradual decline in the birth rate from 1924 to 1931. There were 3,137 more births for 1932 than for 1931.

Stillbirths: In conformity with statistical practice the stillbirths for 1932 were reported as births and deaths but were not included in the totals of either. Parallel to the increase in the number of births there were 225 more stillbirths than last year. The 3,643 stillbirths represent a rate of 46.8 per 1,000 live births. If they were classified as a single cause of death, the rate based on a 100,000 population would be 112.3—only a little less than that of tuberculosis and cancer combined. In every 100 deliveries in North Carolina there were approximately 4 stillbirths.

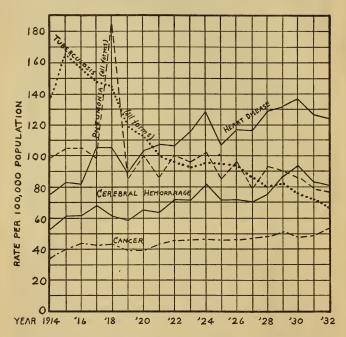

MORTALITY

In the compilation of mortality statistics it is necessary to depend upon physicians for the statement of cause of death. Needless to say the accuracy of statistics can be no greater than that of the material upon which it is based. Every year it is necessary to query hundreds of certificates as to cause of death in order to classify them correctly. We are duly appreciative of the prompt and courteous replies given by most physicians when asked to give a more specific statement as to cause of death.

In conformity with the trend of last year the death rate continued to show a decline for 1932. The 31,000 deaths exclusive of 3,643 still-births, reported for 1932 represents an annual death rate of 9.6 per 1,000 population. When the number of deaths of residents of other states (296) are excluded and the residents of North Carolina (157) who died elsewhere are added the total number of resident deaths 30,861, giving a rate of 9.5. This is the lowest death rate ever recorded in North Carolina. The mortality rate for 1931 was 10.2; for 1930, 11.2; for 1929, 12.4; for 1928, 12.3; and for 1927, 11.3. Considered in terms of total deaths, the deaths reported for 1932 were 2,069 fewer than in 1931, 4,739 fewer than in 1930, and 5,894 fewer than in 1929.

The principal causes of death in order of their importance were heart disease, nephritis, cerebral hemorrhage, pneumonia, tuberculosis, all accidents and cancer. These seven causes together made up 58 per cent of the 31,000 deaths registered.

FIGURE 1. THE DEATH RATE PER 100,000 POPULATION FOR FIVE OF THE PRINCIPAL CAUSES OF DEATH FROM 1914 TO 1932, INCLUSIVE.

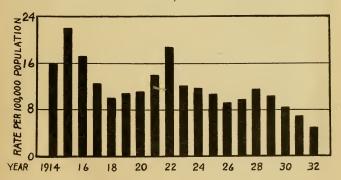

Of the five principal causes given in figure 1 only tuberculosis has shown any marked decline in the past nineteen years. We had a rate of 154.8 per 100,000 population in 1915 and a rate of 68.1 in 1932. The death rate from the pneumonias, including all forms, has fluctuated from year to year, the greatest variation occuring in 1918; but considered over the entire period there has been very little permanent improvement. The death rates from heart disease, cerebral hemorrhage and cancer have been increasing slowly throughout the nineteen years. The deaths from heart disease have increased more rapidly than for any causes shown, although cerebral hemorrhage has been a close second. Likewise, cancer death rates has been gradually increasing. All of the five causes, with the exception of cancer, gave a lower death rate for 1931 than for 1930, and showed further improvement for 1932.

Typhoid Fever: A total of 158 deaths, 3 more than in 1931, giving a rate of 4.9 per 100,000 population was recorded in the State in 1932 from typhoid fever. Of these deaths, 34 occurred in July, 25 in August and 24 in September. The trend in typhoid fever death rates has been consistently downward from 1914 to 1930. The rates for 1930, 1931, and 1932 have remained approximately the same.

Smallpox: This is the first year in the history of the State that no deaths were reported from smallpox. There were 72 cases reported to the Division of Epidemiology. In 1931 there were 63 cases with 2 deaths recorded.

Diphtheria: The total number of deaths and death rate of diphtheria were the lowest ever recorded in the State. There were 165 deaths with a rate of 5.1 per 100,000 population compared to 230 deaths with a rate of 7.2 for 1931. There has been a 77 per cent reduction in the mortality rate from this disease since 1915. Within the past five years the rate has been cut in half. Diphtheria is a disease for which we have a specific protective vaccination and is, therefore, a disease against which public health activities can be very effective. In round numbers five-sixths of the deaths from diphtheria occur in children under five years of age. This indicates the age group in which vaccination can be done most profitably.

FIGURE 2. THE ANNUAL DEATH RATE PER 100,000 POPULATION FOR DIPHTHERIA FROM 1914 TO 1932, INCLUSIVE.

Influenza and Pneumonia: There were 2,538 deaths from pneumonia and 787 deaths from influenza, making a total of 3,325, recorded for 1932. The deaths from these two combined gave a rate of 102.5 per 100,000 population for 1932 as against a rate of 112.4 for 1931. The

decrease was due almost entirely to the fewer number of deaths from influenza.

Tuberculosis: The death rate from all forms of tuberculosis was 68.1 in 1932 and 71.5 in 1931. This represents a reduction of 60 per cent from the 1915 ratio. Tuberculosis has fallen from first place in 1916 to fifth in 1932. The total number is made up of the following classifications:

	Deaths	Rate
Fuberculosis (all forms)	2,208	68.1
Of the respiratory system	2,026	62.4
Of the meninges and central nervous system.	43	1.3
Of the intestines and peritoneum	64	1.9
Of the vertebral column	21	.6
Of the joints	11	.3
Of other organs	11	.3
Disseminated tuberculosis	32	1.0

Of the 2,208 deaths 47 per cent were males and 53 per cent females, 42.3 per cent white, 57.1 per cent negro and 0.6 per cent indian. The colored rate for tuberculosis is more than three times that of the white rate.

Cancer: Cancer accounted for 1,657 deaths in 1932 giving a rate of 51.1 against a rate of 48.2 for 1931. While the trend of cancer mortality has been steadily upward it is not unreasonable to hope for at least a retarding in the increase. Early diagnosis offers a genuine opportunity for a cure. If the public can be convinced of this fact the ascending rate will be checked.

Pellagra: The deaths from pellagra showed a very marked decline over 1931. In 1932 there were 475 deaths with a rate of 14.6, a decrease of about 30 per cent from the number and rate of 1931 when there were 696 deaths with a rate of 21.6. In 1930 there were 1,015 deaths from pellagra recorded giving a rate of 31.8 per 100,000 population. The deaths from this cause began to increase in 1924 and continued to increase yearly until 1930. The decrease for the last two years has been rapid.

Suicides and Homicides: The deaths from suicides decreased and those from homicides increased for 1932, making the total from the two causes approximately the same as for 1931. There were 288 suicidal and 392 homicidal deaths.

Accidental Causes: Automobile accidents accounted for the greatest number of accidental deaths in 1932. However, there were fewer deaths from automobile accidents (total) than in 1931. There were 604 in 1932 and 686 in 1931. The rate for 1932 was 18.6 and for 1931 21.3 per 100,000 population. Railroad accidents increased from 117 in 1931 to 134 in 1932.

Maternal Mortality: The diseases of pregnancy, childbirth and the puerperal state continued to exact a large toll from the mothers of the State. The deaths recorded as due to maternal causes accounted for far too great a number in proportion to the number of live births. However, we are grateful for the slight improvement shown over 1931. There was a decrease from 640 puerperal deaths in 1931 to 560 for 1932. This decrease in number together with an increase in the number of births lowered the rate from 8.6 per 1,000 live births for 1931 to 7.2 for 1932. This is in excess of the rate of approximately 6.5 for the United States Registration Area. There were 310 white, 6 indian and 244 negro puerperal deaths. This gave a rate of 5.8 for the white, 9.6 for the indian and 10.3 for the negro.

TABLE A. MATERNAL MORTALITY BY RACE, 1928 to 1932, Inclusive.

		White			Negro			Total	
Year	No. Live Births	No. Mat. Deaths	Mat. Rate	No. Live Births	No. Mat. Deaths	Mat. Rate	No. Live Births	No. Mat. Deaths	Mat. Rate
1928 1929	55,813 53,266	382 402	6.8 7.5	24,551 23,392	277 279	11.2 11.9	80,887 77,164	664 684	8.2 8.9
1930	53,515 51,806	363 359	6.7 6.9	22,681 22,360	277 277	12.2 12.3	76,717 74,743	645 640	8.4 8.6
1932	53,655	310	5.8	23,602	244	10.3	77,880	560	7.2

There has been only a slight change in the maternal death rate for the past five years. With the exception of the present year the rate has not been below 8.2 per 1,000 live births during this period. The annual rates for the five year period are 6.8 for the white, 11.6 for the negro and a total of 8.2 per 1,000 live births.

Table B gives the number of deaths and the rate per 1,000 live births by individual cause for the three years 1930 to 1932, inclusive.

TABLE B. MATERNAL DEATHS AND DEATH RATES BY CAUSES, 1930 to 1932, INCLUSIVE.

	19	30	19	31	1932	
	No. Deaths	Rate	No. Deaths	Rate	No. Deaths	Rate
Abortion with septic conditions	27	.35	26	.35	27	.35
Abortion without septic conditions	36	.47	29	.39	26	.33
Ectopic gestation	7	.09	12	.16	9	.12
Other accidents of pregnancy (Not to include						
hemorrhage)	7	.09	17	.23	23	.30
Puerperal hemorrhage		.80	76	1.02	68	.87
Puerperal septicemia	112	1.46	117	1.56	80	1.03
Puerperal albuminuria and eclampsia	221	2.88	198	2.65	185	2.38
Other toxemias of pregnancy	25	.32	38	.51	37	.48
Puerperal phlegmasia alba dolens, embolus, sud-						
den death	37	.48	42	.56	24	.31
Other accidents of childbirth	109	1.42	85	1.14	79	1.01
Other and unspecified conditions of the puerperal		·				
state	. 3	.04	0		2	.02
Total	645	8.41	640	8.56	560	7.19

The death rates for all puerperal causes combined were approximately the same for 1930 and 1931 and slightly lower for 1932. The same specific causes uniformaly produced the greatest number of deaths each year.

The number of maternal deaths and the rates per 1,000 live births by race according to the detailed International List are given for 1932 in table C.

TABLE C. Maternal Deaths and Death Rates by Cause and Race, 1932.

	Wh	ite	Cole	red	Total			
	Deaths	Rate	Deaths	Rate	Deaths	Rate	Per Cent	
All causes	310	5.78	244	10.34	560	7.19	100.0

bolus, sudden death	16	-30	7	.30	24*	.31	4.3	
Other accidents of childbirth	43	.80	34	1.44	79†	1.01	14.1	
Other and unspecified conditions of the					1			
puerperal state	1	.02	1	.04	2	.02	0.4	

^{* 1} Indian.

Albuminuria and eclampsia accounted for more of the puerperal deaths than any other single cause. Approximately a third of the deaths were due to this cause. The second and third greatest offenders were puerperal septicemia and other accidents of childbirth, respectively. Eighty maternal deaths were chargeable to puerperal septicemia and 79 to other accidents of childbirth. Seventy-four per cent were due to albuminuria and eclampsia, septicemia, other accidents of childbirth and hemorrhage.

Infant Mortality: The total number of deaths under one year of age was 5,173. Both the rate of 66.4 per 1,000 live births and the number of infant deaths were lower than in any previous year. There were 5.459 deaths with a rate of 73.0 per 1,000 live births for 1931. Of the

^{† 2} Indians.

total deaths 3,064 were white and 2,109 colored. This gave a white rate of 57.1 and a colored rate of 87.1.

Of the total number of deaths under one year of age 1,209 occurred under one day of age, and almost half (2,424) in the first two weeks. The following table gives the number of infant deaths by certain subdivisions of the first year of life:

Age Groups	Deaths	Per Cent
Under one year (total)	5,173	100.0
Under 1 day	1,209	23.4
1 day	289	5.6
2 days	215	4.2
3-6 days	392	7.6
7-13 days	319	6.2
14-20 days	197	3.8
21-29 days	179	3.5
Under 1 month	2,800	54.1
1 month	479	9.3
2 months	355	6.9
3-5 months	726	14.0
6-8 months	479	9.3
9-11 months	334	6.5

Over half of the deaths under one year of age are caused by the group known as "diseases of early infancy." The rate per 1,000 live births for this group of causes was 26.3 in 1922 and 37.8 in 1932. Classified separately the deaths are as follows:

	Rate
Diseases of early infancy (total)	37.8
Congenital malformations	3.1
Congenital debility	
Premature birth	
Injury at birth	
Other diseases peculiar to early infancy	

Mortality from this group of causes, to which fall victims mainly infants under one month old, has changed but slightly or has actually increased. Deaths from these causes must be lowered if the present death rate of infants is to be improved. The progress made in saving young lives has been due primarily to the reduction in the number of deaths from infectious diseases and gastrointestinal diseases. Diarrhea and enteritis as a cause of infant mortality has been reduced materially. The death rate from this cause calculated for infants under one year of age has fallen from 10.1 per 1,000 live births in 1914 to 6.2 in 1932.

Every birth and death occuring in North Carolina should be recorded with the Bureau of Vital Statistics. Birth and death records have a wide variety of uses which are of great importance to individuals. Vital statistics are of practical value to every citizen of the State. For health organizations, accurate certificates are essential if our true problems are to be known, if our programs are to be intelligently planned, if we are to ascertain the effectiveness of procedure, and if errors in our work are to be detected. Incomplete or incorrect records may lead to costly mistakes. It is, therefore, incumbent upon every citizen of North Carolina to do whatever possible to promote the completeness of our birth and death records.

TABLE I—TOTAL BIRTHS AND DEATHS (EXCLUSIVE OF STILLBIRTHS) WITH RATE PER 1000 POPULATION FOR THE YEARS 1914-1932 INCLUSIVE
